

An Interactive Interferometer for Outreach

Austin Peel, Emma Tolley, Shreyam Parth Krishna, Michele Bianco

SKACH Spring Meeting 1/6/2023

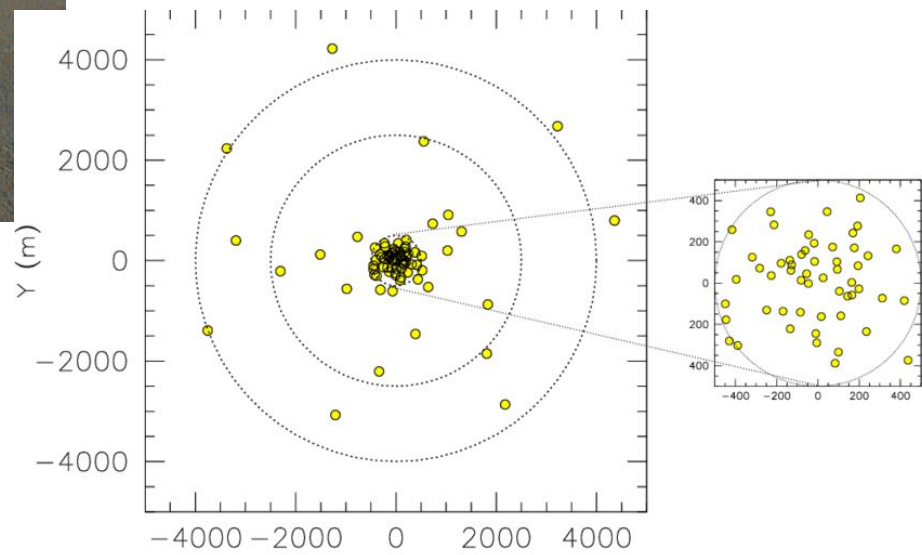

2019: MeerKAT telescope with 64 dishes

Radio Interferometric Imaging Process

$$x_l(t) = \int S(r) g_l^*(r) e^{-j \frac{2\pi}{\lambda_c} (t - \langle p_l, r \rangle)} dr \quad \text{Discretization} \rightarrow x_l(t) = \sum \sum S[i, j] g_l^*(r_{ij}) e^{-j \frac{2\pi}{\lambda_c} (t - \langle p_l, r_{ij} \rangle)} dr$$

Notation

$$x = AS \quad \text{Beamforming} \rightarrow y = W^H AS = B^* S$$

$$y = B^* S \quad \text{Correlator} \rightarrow y_i y_j = Y$$

Best reconstructed source emissions

$$\begin{aligned} \hat{S} &= \tilde{B} y \\ \hat{I} &= \tilde{D} Y \end{aligned}$$

Find a least squares fit for the sky image.

Learning Goals:

- Interferometry not trivial to explain, especially without mathematics!
- Tool to help with the explanation
 - Visual
 - Demonstrative
 - Intuitive understanding
 - Tunable - more/less detail depending on the audience

INTRO TO ASTROPHYSICS I

Help us improve by submitting (anonymous) feedback [here!](#)

This website contains interactive applications for learning and visualising concepts in astrophysics. The apps are being developed by Dr. Austin Peel and Prof. Frédéric Courbin to accompany the Introduction to Astrophysics I course at EPFL. This project was supported by the Digital Resources for Instruction and Learning ([DRIL](#)) Fund.

We recommend viewing the apps in a **Chrome**, **Firefox**, or **Brave** browser window.

Special thanks to Théo Damiani and Noah Kaltenrieder for their work on the Tidal Locking and Mass of a Globular Cluster apps!

CHAPTER 1 : PLANETARY MOTION

Explore the motion of celestial bodies through interactive web applications. Understand Kepler's famous three laws of planetary motion.

Two-Body Problem

Kepler's First Law

Kepler's Second Law

Kepler's Third Law

Mockup Idea

Mockup Idea

Future Plans:

- Multiple time-step UV sampling
- Comparison with Optical
