Field level model for HI: mocks and applications

Andrej Obuljen (University of Zurich)

arXiv: 2207.12398

SKACH Spring Meeting Versoix
02.06.2023

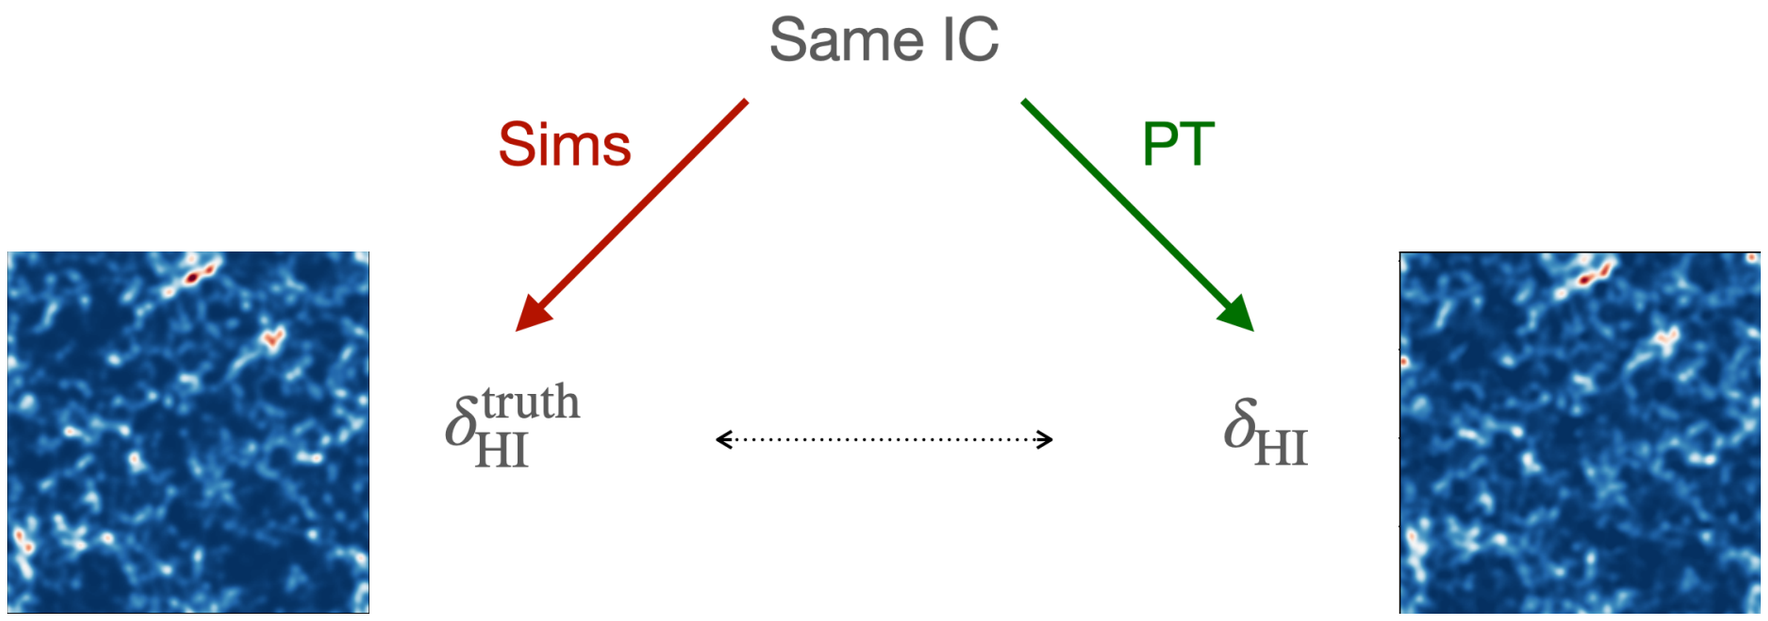
Motivation

- 21cm IM surveys mainly sensitive to perturbative scales
- We showed we can model HI at the field level using PT+bias models (Schmittfull+18)
- HI noise properties –> reconsider cosmological analysis
- Generate fast and accurate 3D mocks: **Hi-Fi mocks**
- Application of Hi-Fi mocks

Field level approach

Advantages

- Pixel-by-pixel agreement → agreement of all summary statistics
- No overfitting
- Easy to isolate and study noise
- No cosmic variance for same IC, no need for large hydro sims.



What is the PT model?

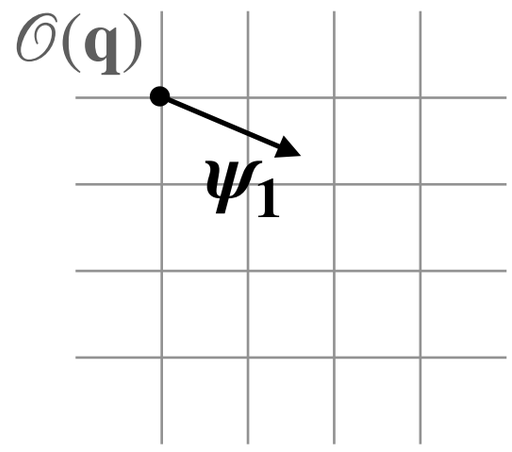
Hybrid Lagrangian and Eulerian scheme, bulk flows included, only linear fields

$$\delta_{\rm HI}(\mathbf{k}) = \int d^3\mathbf{q}(1 + b_1^L\delta_1 + b_2^L(\delta_1^2 - \sigma_1^2) + b_{\mathcal{G}_2}^L\mathcal{G}_2 + \ldots - i\mathbf{k}\cdot\boldsymbol{\psi_2} + \ldots)e^{-i\mathbf{k}(\mathbf{q}+\boldsymbol{\psi}_1)}$$

Zel'dovich displacement

Define *shifted bias operators* in Eulerian space:

$$\tilde{\mathcal{O}}(\mathbf{k}) = \int d^3\mathbf{q}\mathcal{O}(\mathbf{q})e^{-i\mathbf{k}(\mathbf{q}+\boldsymbol{\psi}_1(\mathbf{q}))},$$



where $\mathcal{O} \in \{1, \delta_1, \delta_2, \mathcal{G}_2, \delta_3, \ldots\}$

$$\delta_{\rm HI}(\mathbf{k}) = \beta_1(k)\tilde{\delta}_1(\mathbf{k}) + \beta_2(k)\tilde{\delta}_2^{\perp}(\mathbf{k}) + \beta_{\mathcal{G}_2}(k)\tilde{\mathcal{G}}_2^{\perp}(\mathbf{k}) + \ldots + \text{noise}$$

Transfer functions

Matches 1-loop EFT & CLPT power spectrum

Measure of success

How to compare model & truth at the field level?

- Minimise mean-squared difference/residuals:

$$P_{\rm err}(k) \equiv \langle\, |\, \delta_{\rm HI}^{\rm truth}(\mathbf{k}) - \delta_{\rm HI}^{\rm model}(\mathbf{k})\, |^2 \,\rangle$$

by doing least squares in each k-bin to obtain best-fit transfer functions:

$$\beta_i = \langle \mathcal{O}_i^{\perp} \delta_{\rm HI}^{\rm truth*} \rangle / \langle\, |\, \mathcal{O}_i^{\perp}\, |^2 \,\rangle$$

- Example:

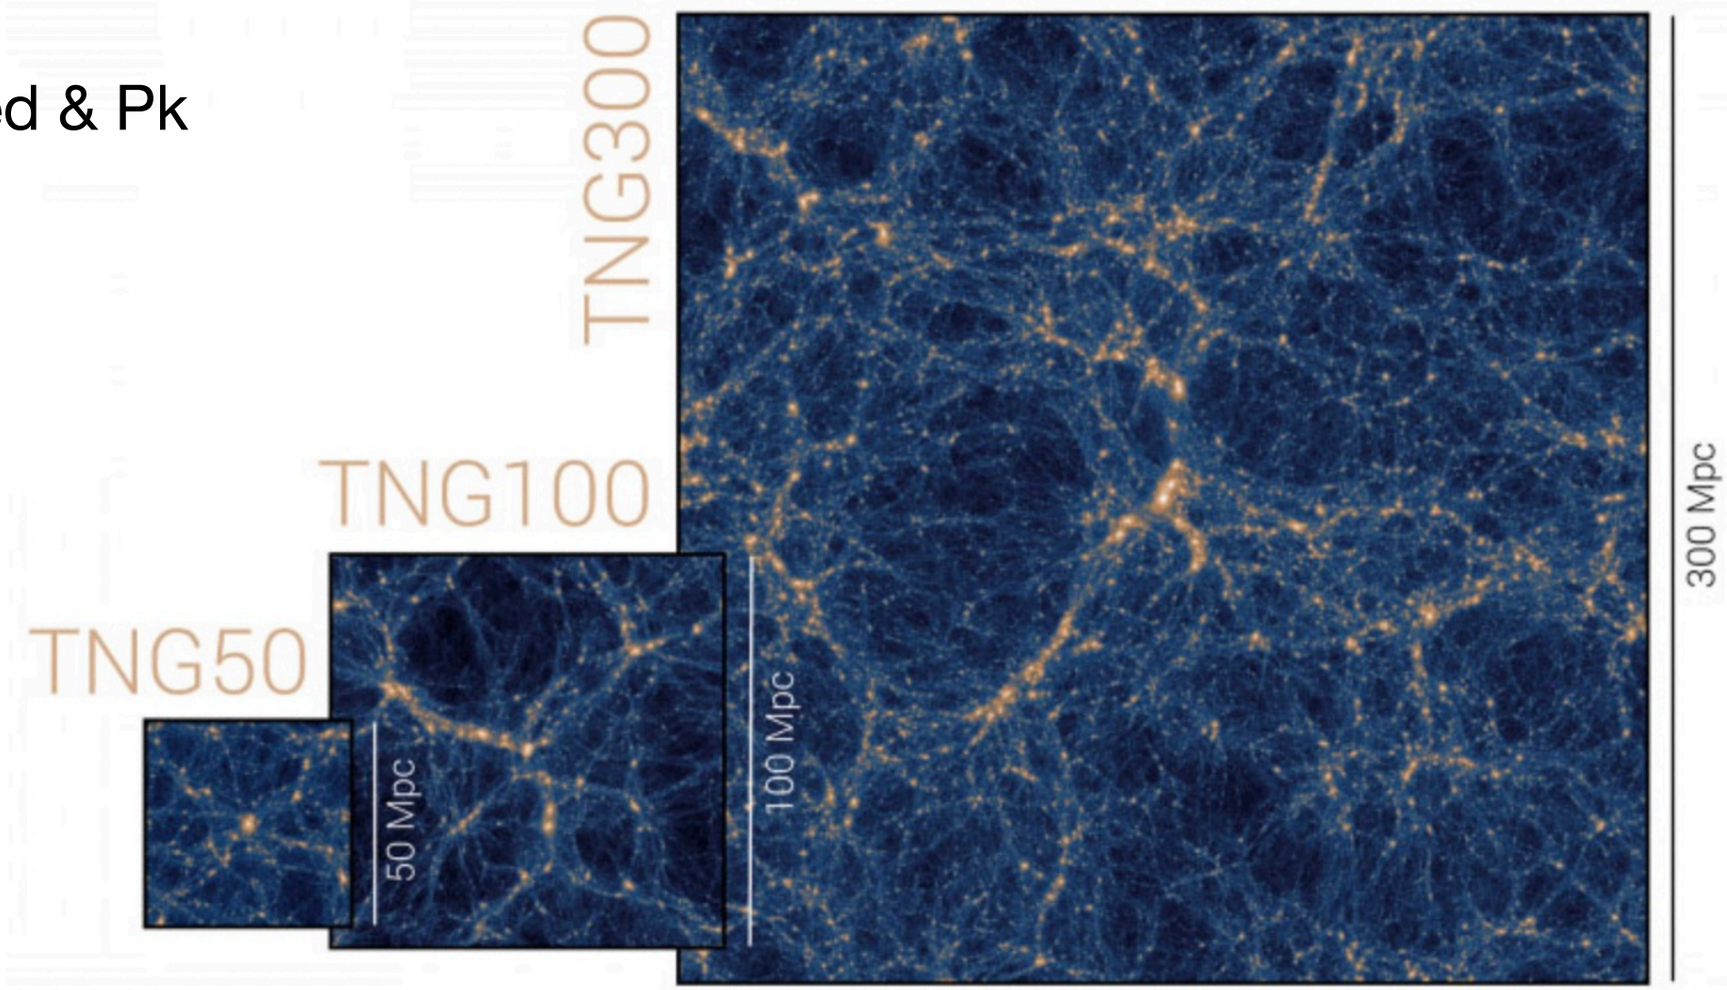
$$\delta_{\rm HI} = b_1 \delta + \epsilon$$

$$b_1(k) = \langle \delta_{\rm HI}^{\rm truth} \delta* \rangle / \langle\, |\, \delta\, |^2 \,\rangle$$

$$P_{\rm err}(k) = \langle\, |\, \epsilon\, |^2 \,\rangle$$

HI from IllustrisTNG

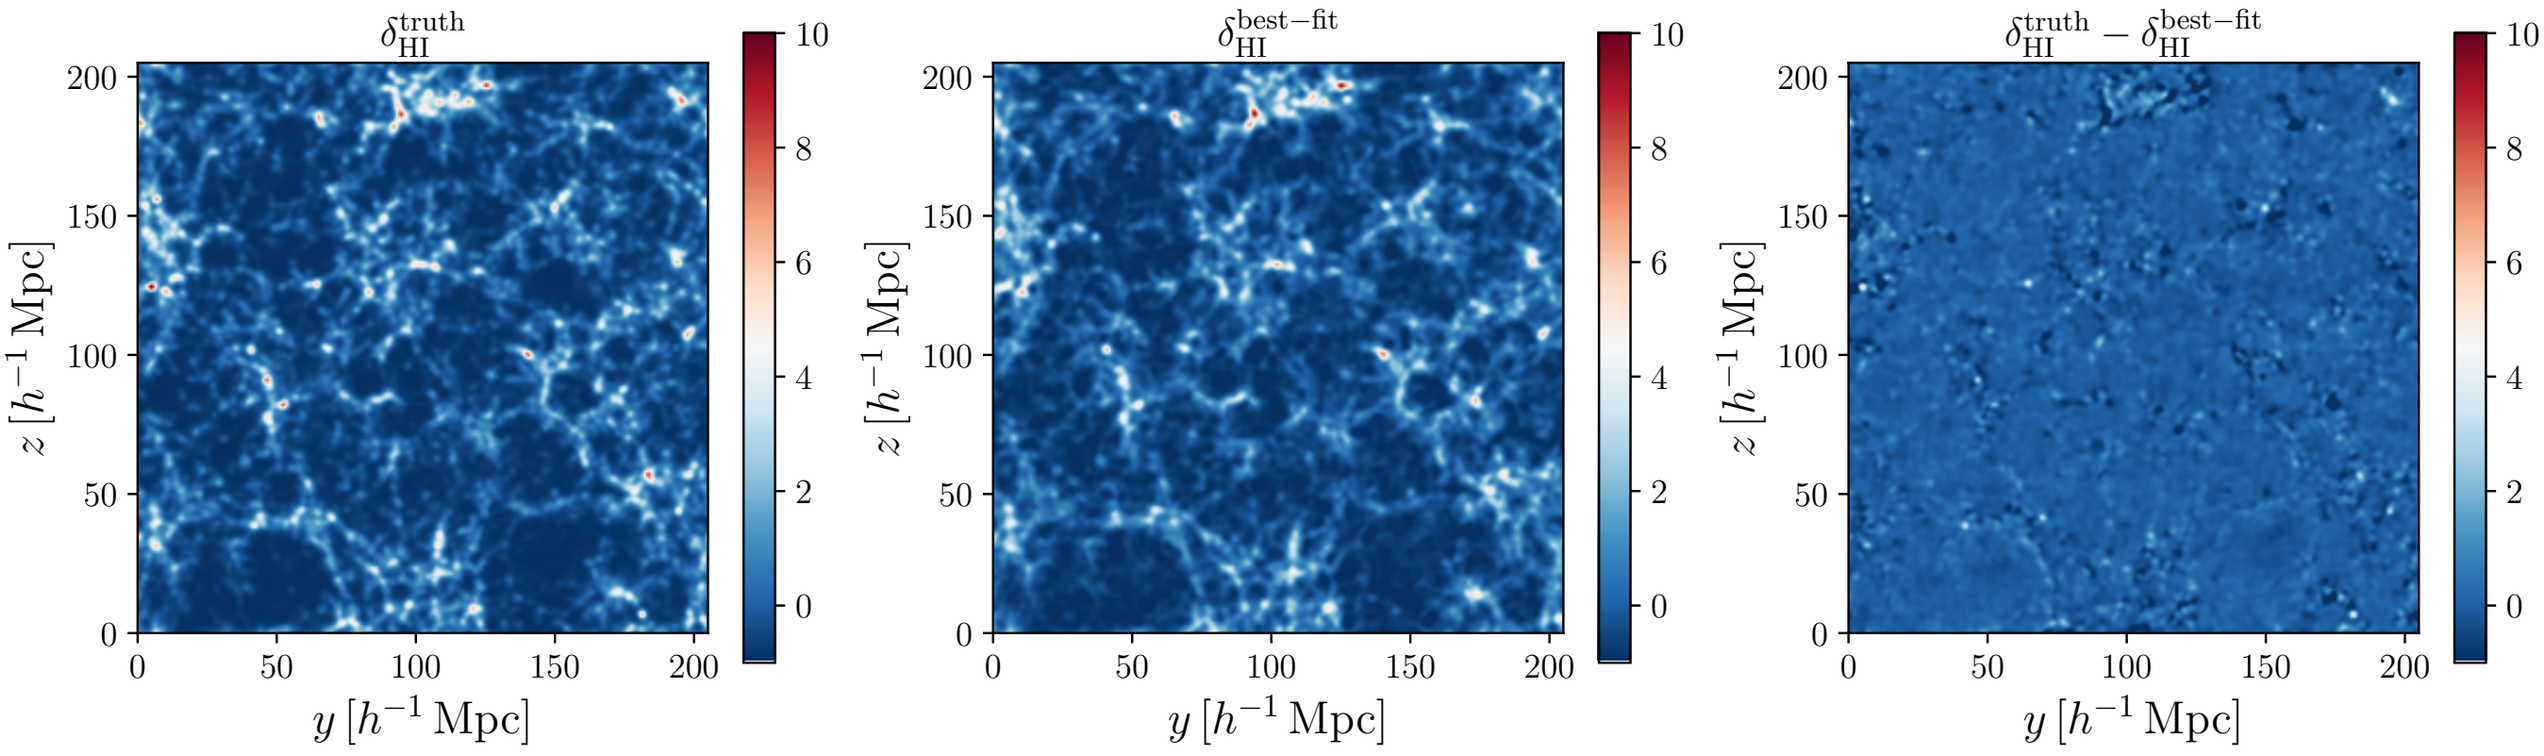
- We apply this approach to a full hydro simulation
- TNG300-1 ($L = 205\,h^{-1}\mathrm{Mpc}$)
- HI in post-processing (Villaescusa+18)
- Same IC: random seed & Pk



Results – 3D fields

$z = 1$, real space

$$\delta_{\rm HI}(\mathbf{k}) = \beta_1(k)\tilde{\delta}_1(\mathbf{k}) + \beta_2(k)\tilde{\delta}_2^{\perp}(\mathbf{k}) + \beta_{\mathscr{G}_2}(k)\tilde{\mathscr{G}}_2^{\perp}(\mathbf{k}) + \beta_3(k)\tilde{\delta}_3^{\perp}(\mathbf{k}) + \ldots + \text{noise}$$

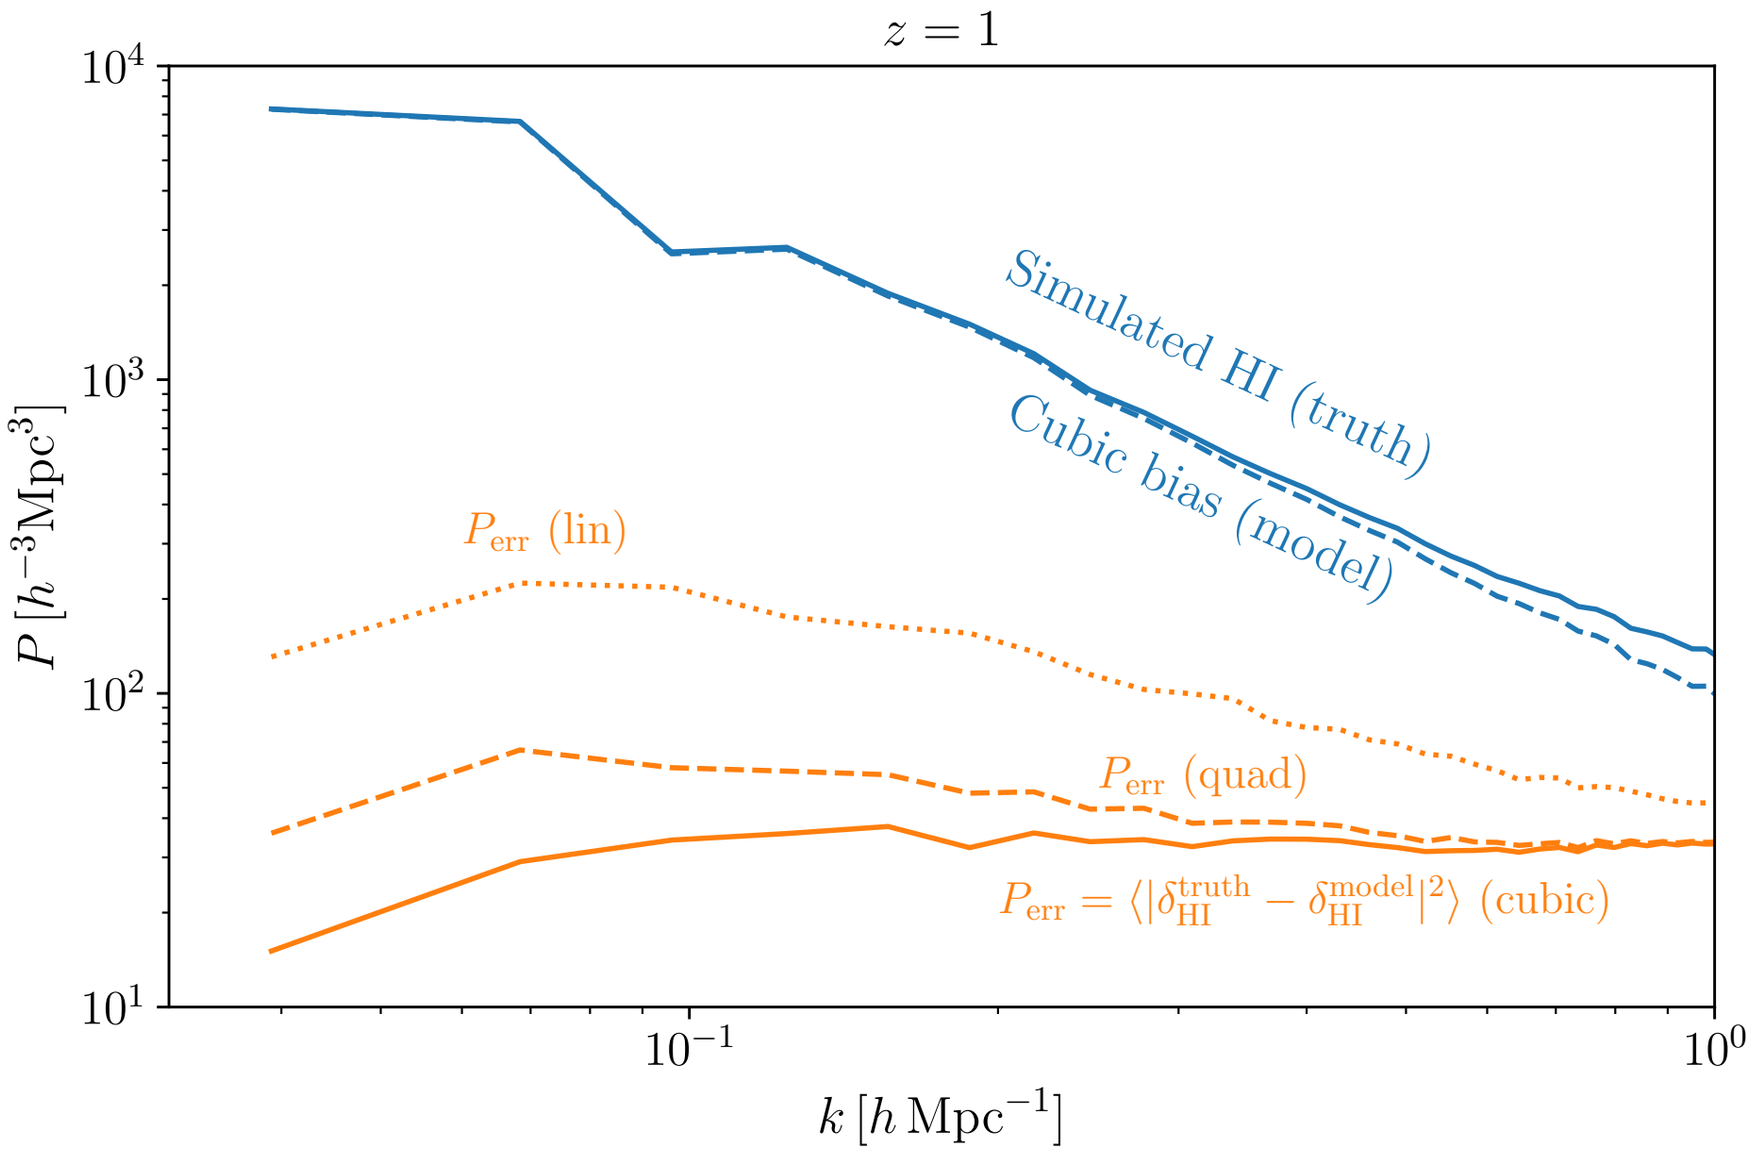


Slice depth 20 Mpc/h, smoothed 1 Mpc/h Gaussian

Results – power spectrum

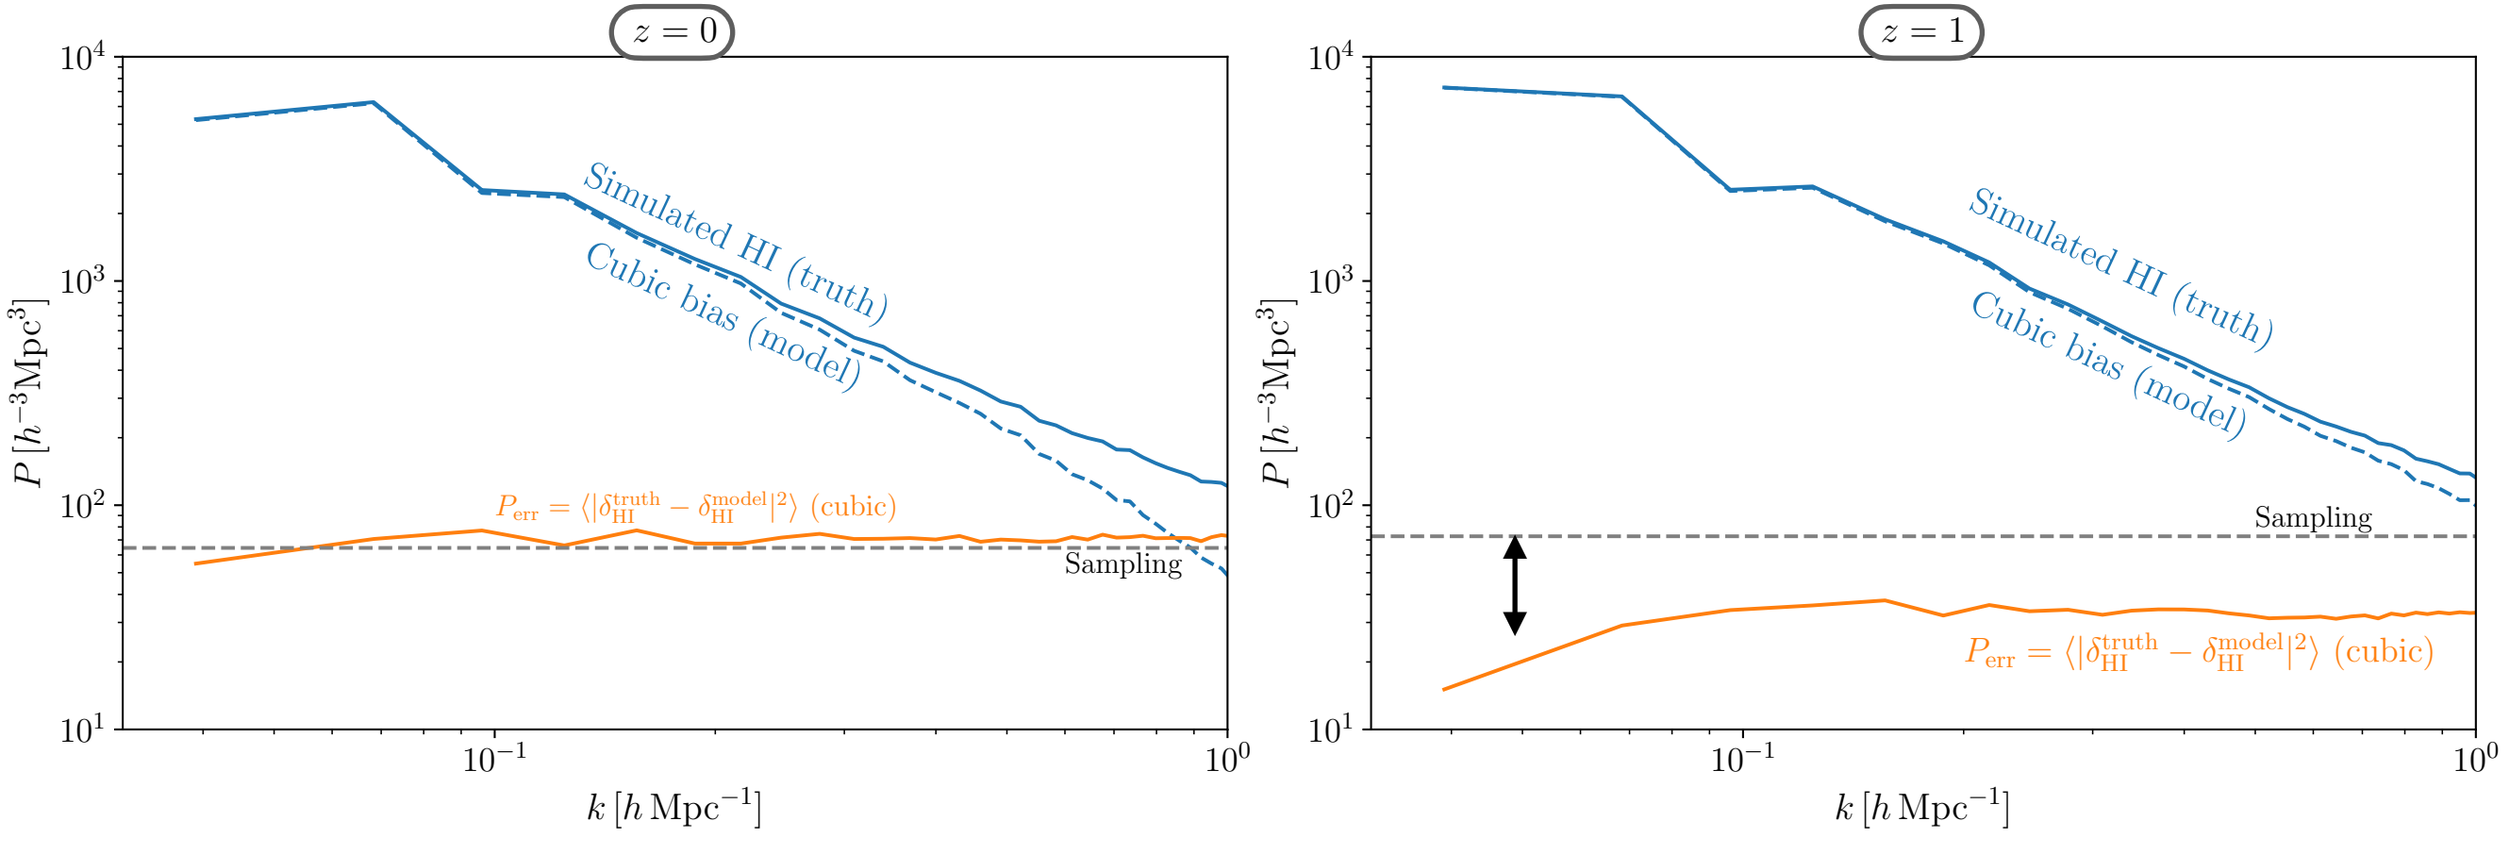
$z = 1$, real space

$$\delta_{\rm HI}(\mathbf{k}) = \beta_1(k)\tilde{\delta}_1(\mathbf{k}) + \beta_2(k)\tilde{\delta}_2^{\perp}(\mathbf{k}) + \beta_{\mathscr{G}_2}(k)\tilde{\mathscr{G}}_2^{\perp}(\mathbf{k}) + \beta_3(k)\tilde{\delta}_3^{\perp}(\mathbf{k}) + \ldots + \text{noise}$$



HI noise properties

- $P_{\rm err}$ flat after including higher order terms
- $P_{\rm err}$ amplitude comparable to sampling noise (~1/nbar), not equal!

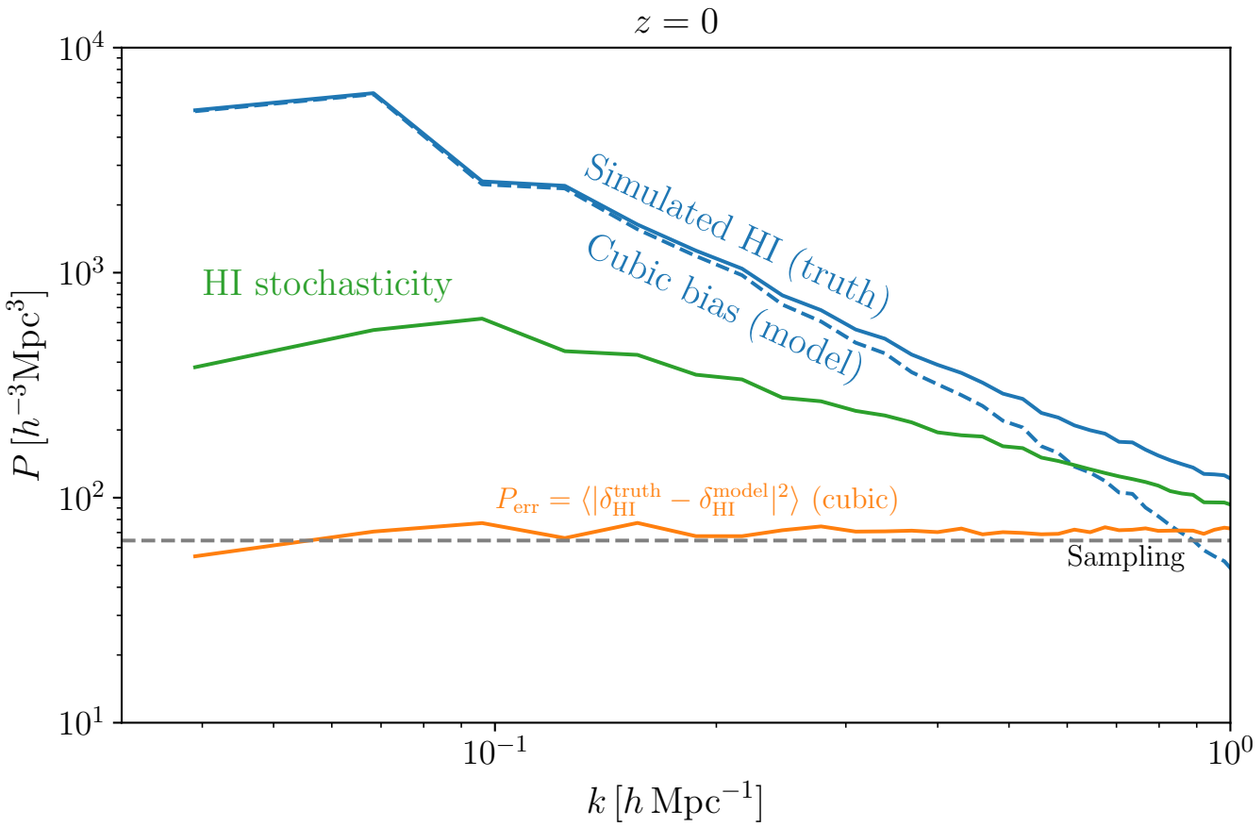


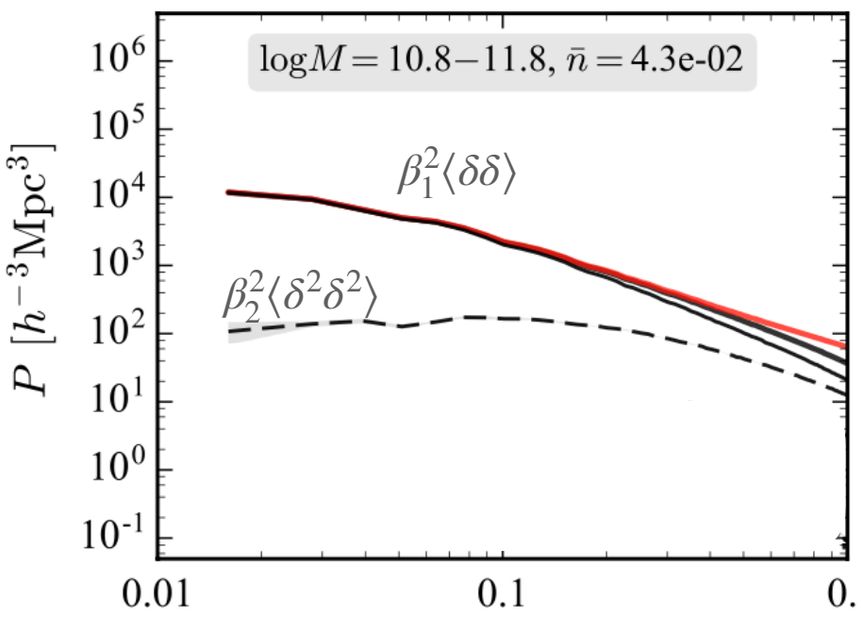
HI noise properties

- HI stochasticity: $\langle\, |\, \delta_{\rm HI}^{\rm truth} - b_1 \delta_{\rm m}\, |^2 \,\rangle$
- $P_{\rm err}$ lower than stochasticity

$$\delta_{\rm HI}(\mathbf{k}) - \beta_1 \tilde{\delta}_1(\mathbf{k}) = \beta_2 \tilde{\delta}_2^{\perp}(\mathbf{k}) + \beta_{\mathcal{G}_2} \tilde{\mathcal{G}}_2^{\perp}(\mathbf{k}) + \ldots + \epsilon$$

- In contrast to galaxy surveys, higher order terms dominate $P_{\rm err}$

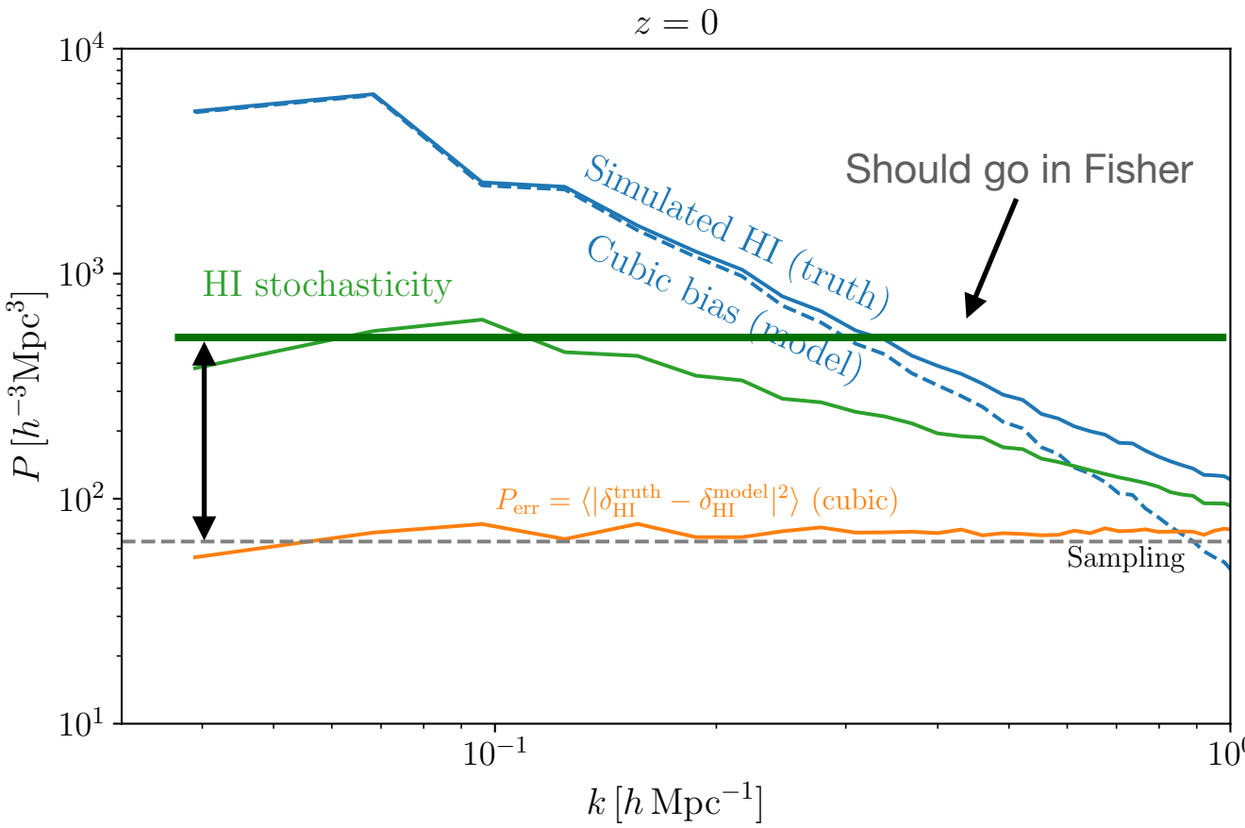


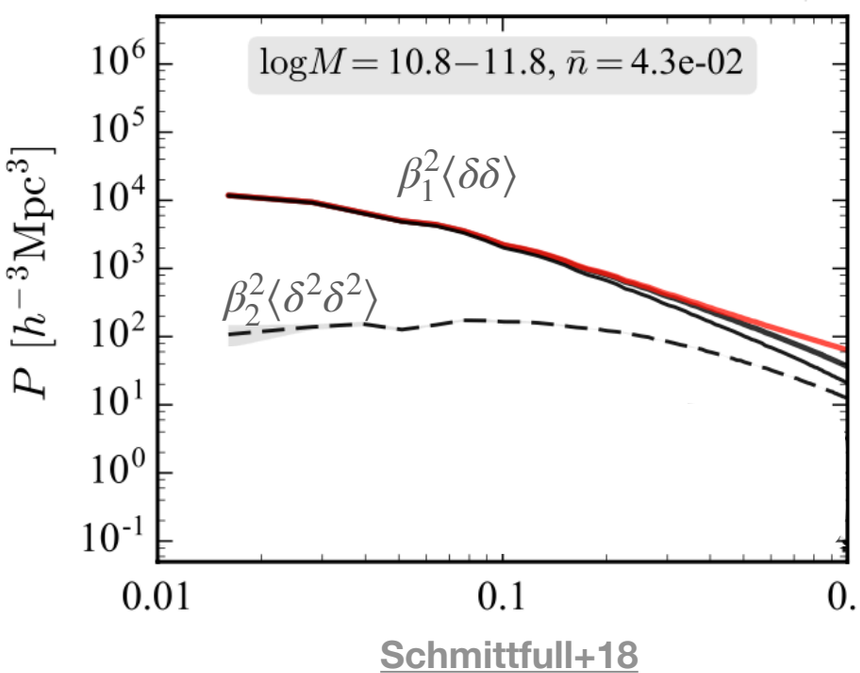


Schmittfull+18

HI noise properties

- For Pk, higher order terms flat & degenerate with noise
- Most Fisher forecasts for Pk assume sampling noise (optimistic)
- Field level may do better!
- For current noise levels, improvement modest…

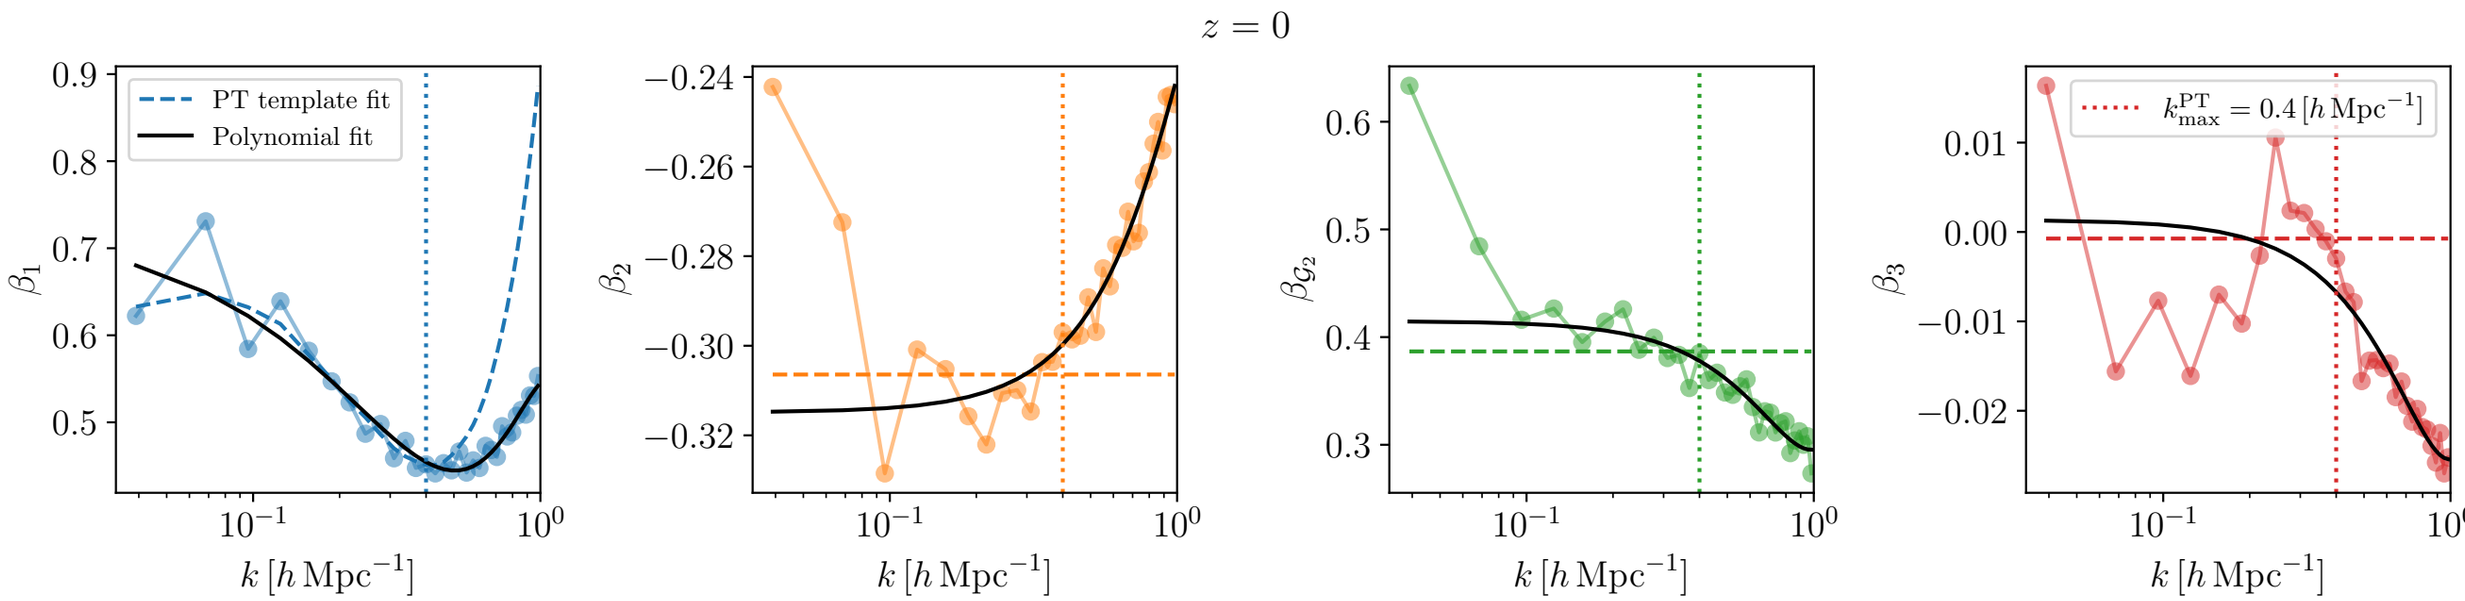




Schmittfull+18

Transfer functions

$z = 0$, real space



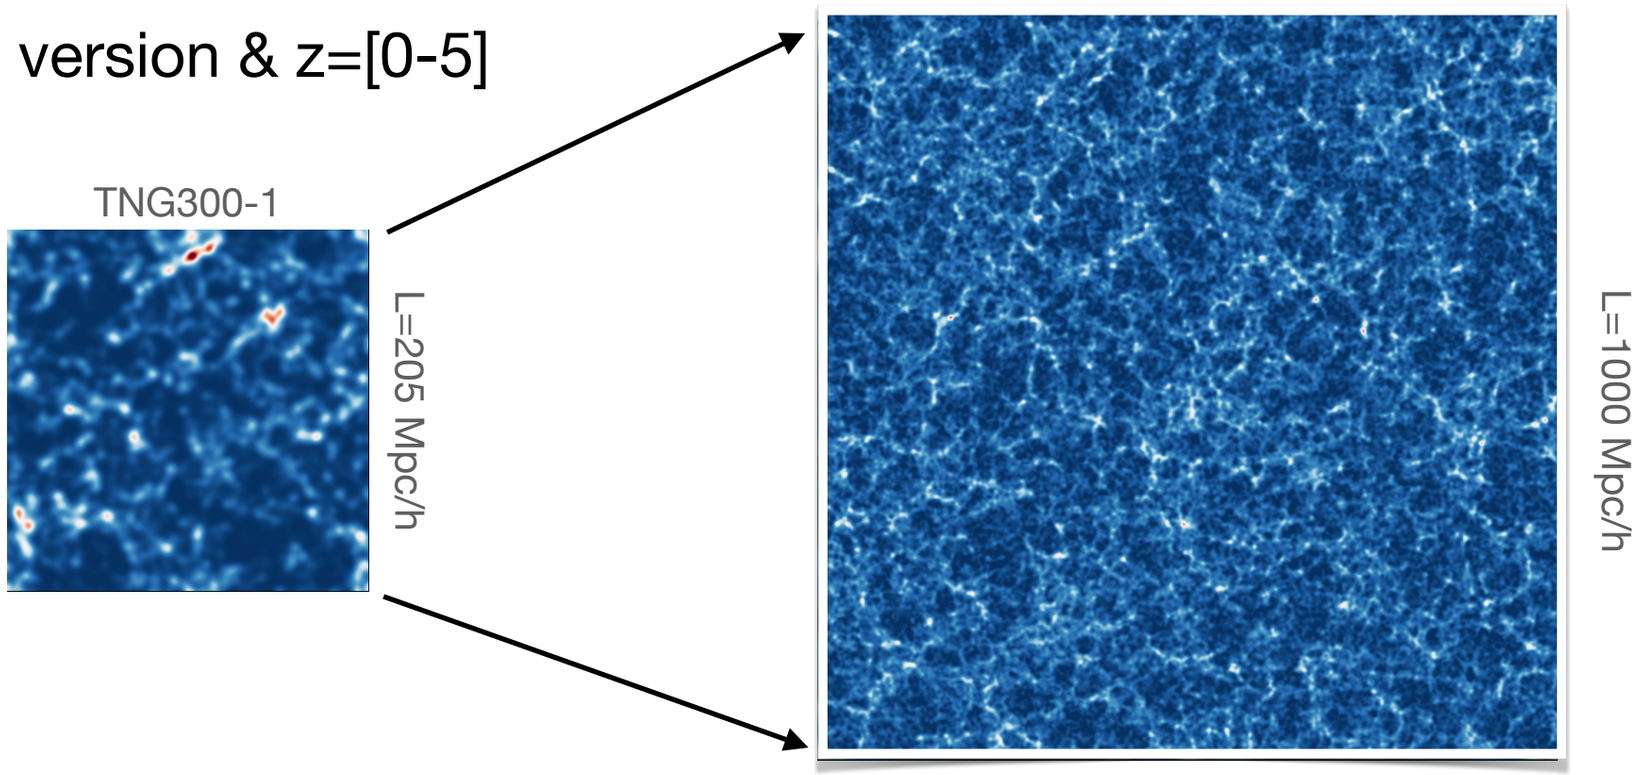
$$\delta_{\rm HI}(\mathbf{k}) = \beta_1(k)\tilde{\delta}_1(\mathbf{k}) + \beta_2(k)\tilde{\delta}_2^{\perp}(\mathbf{k}) + \beta_{\mathcal{G}_2}(k)\tilde{\mathcal{G}}_2^{\perp}(\mathbf{k}) + \beta_3(k)\tilde{\delta}_3^{\perp}(\mathbf{k}) + \ldots + \text{noise}$$

$$\beta_1^{\rm real}(k) = a_0 + a_1 k + a_2 k^2 + a_4 k^4,$$
$$\beta_{i\neq 1}^{\rm real}(k) = a_0 + a_2 k^2 + a_4 k^4$$

Hi-Fi mocks

https://github.com/andrejobuljen/Hi-Fi_mocks

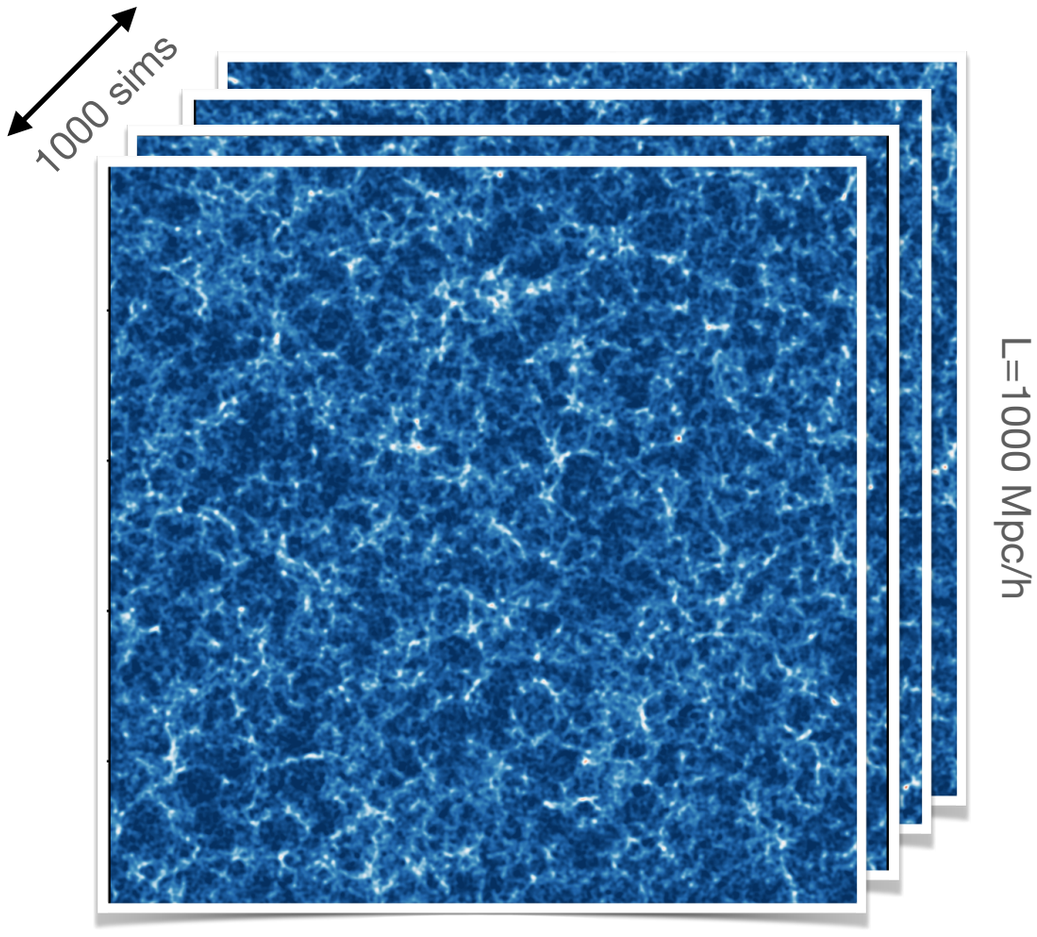
- Generate fast 3D HI field (Hi-Fi) level mocks
- Tuned to TNG HI clustering
- Extendable to any volume!
- Real & redshift space
- Publicly available, give it a try!
- Very soon parallelised version & z=[0-5]



Hi-Fi mocks

https://github.com/andrejobuljen/Hi-Fi_mocks

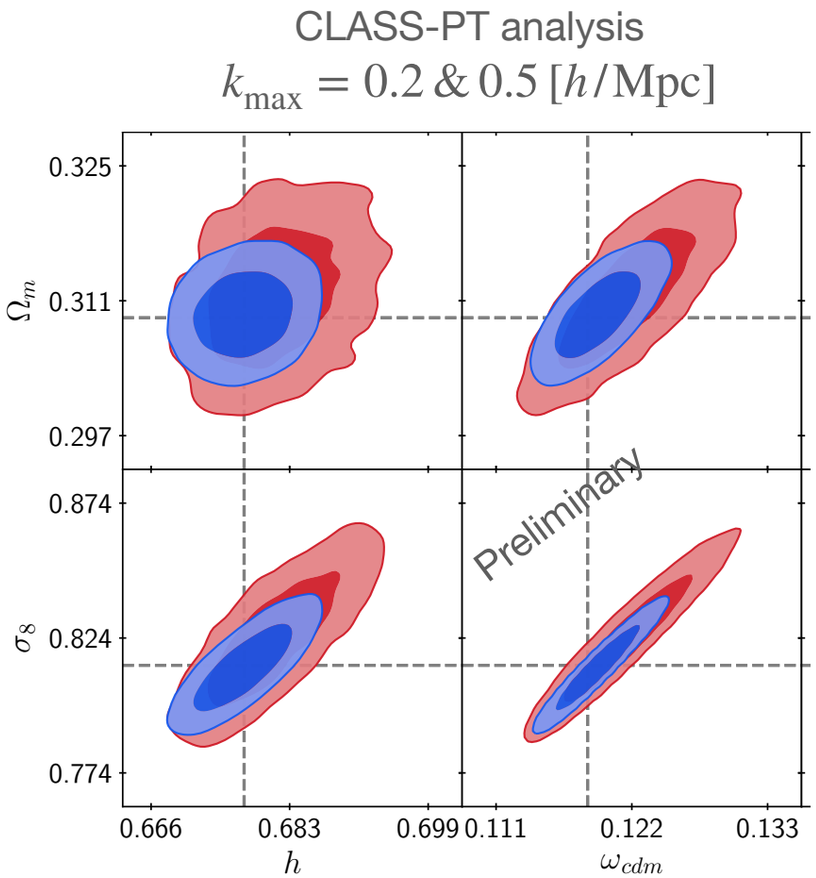
- Generate fast 3D HI field (Hi-Fi) level mocks
- Tuned to TNG HI clustering
- Extendable to any volume!
- Real & redshift space
- Publicly available, give it a try!
- Very soon parallelised version & z=[0-5]



Hi-Fi mocks

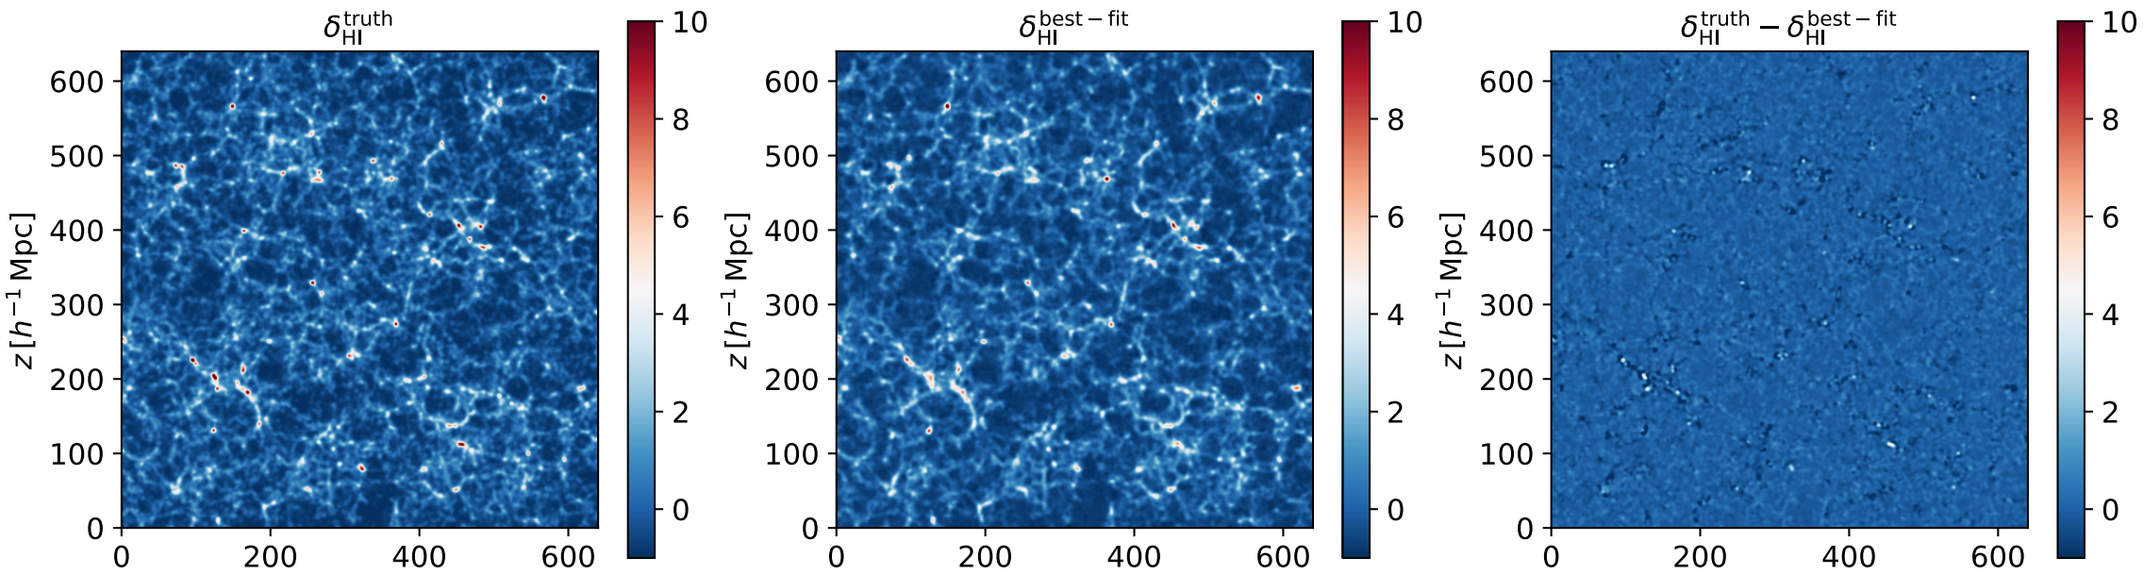
https://github.com/andrejobuljen/Hi-Fi_mocks

- Preliminary!
- 10 x Gpc/h HI fields for Pk
- 1000 fields for covariance matrix
- Pk analysis in real space
- Unbiased cosmology $k_{\rm max} = 0.5$
- Coming soon: Pk in z-space, bispectrum…

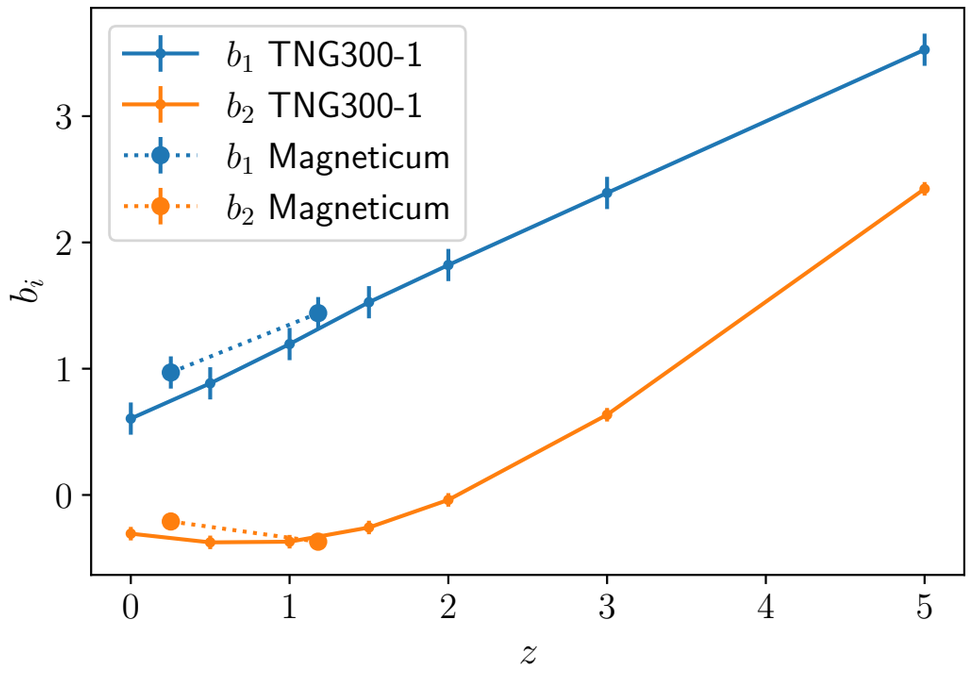


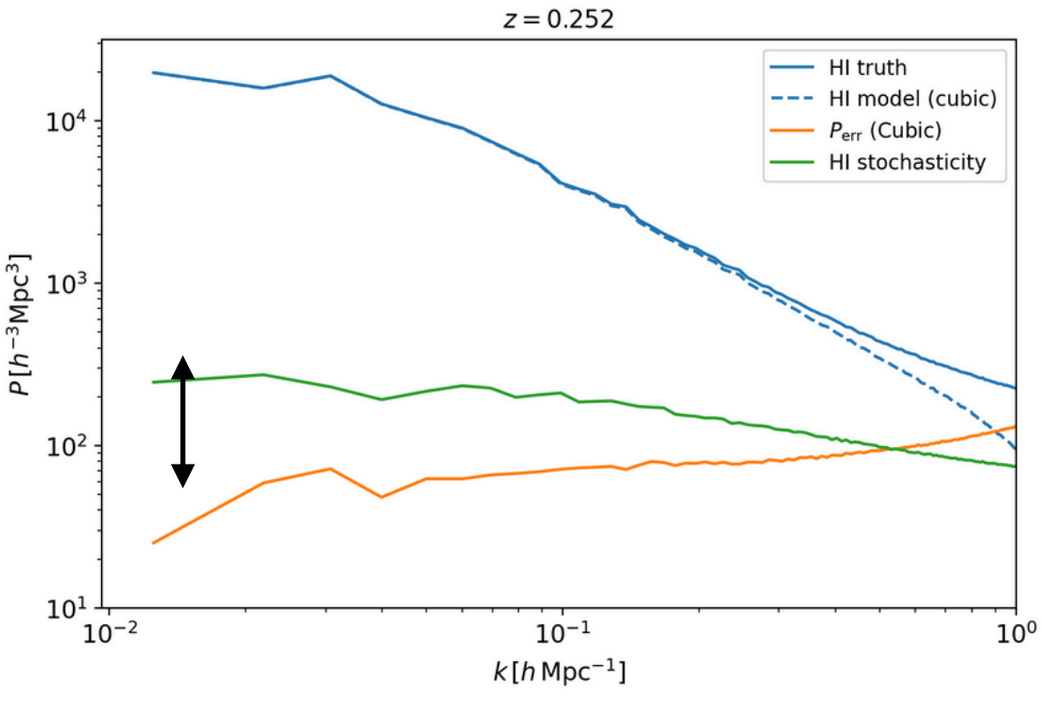
Other hydro sims?

Magneticum Box2bhr (640 Mpc/h)



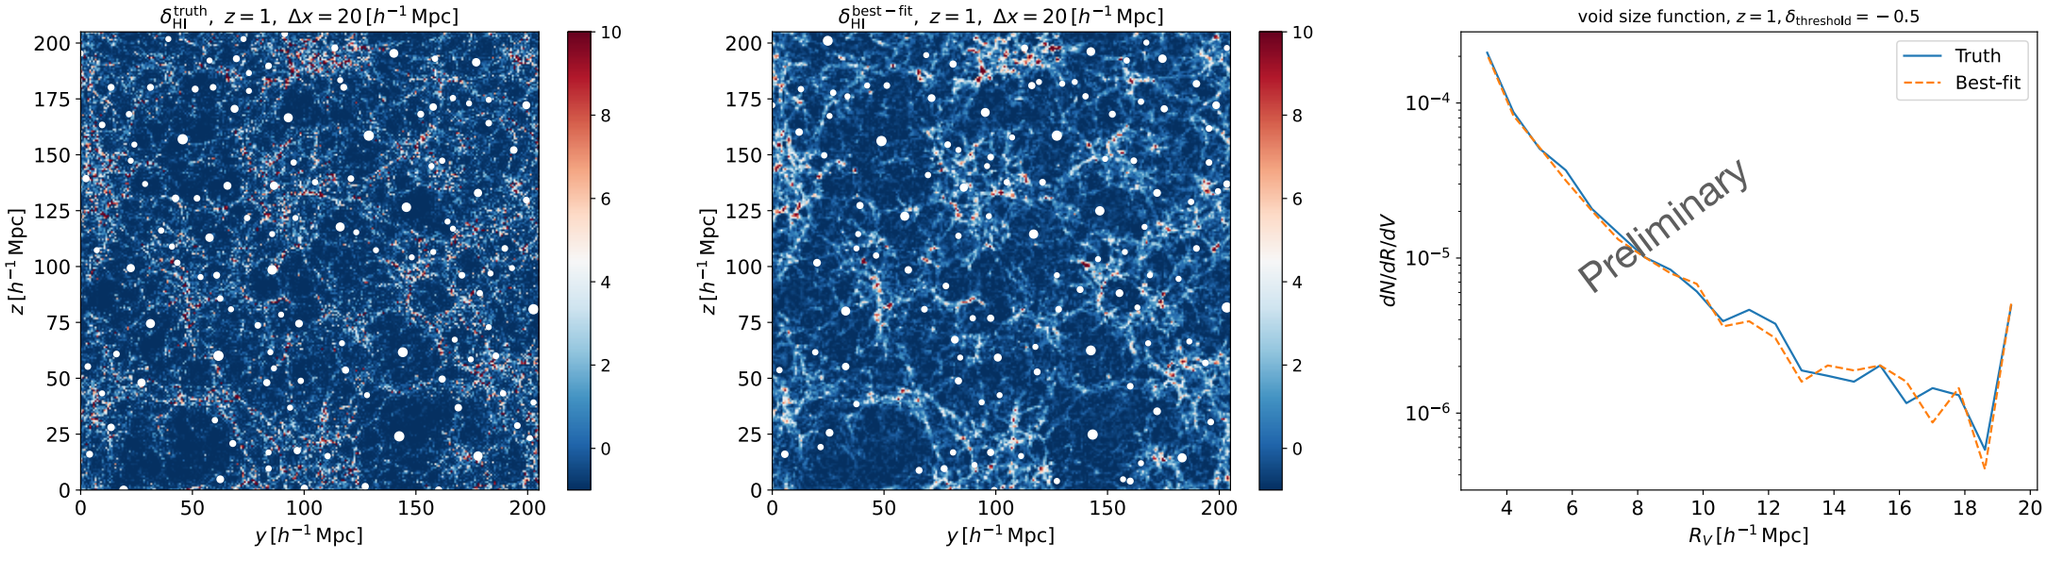
Slice depth 20 Mpc/h, smoothed 2 Mpc/h Gaussian



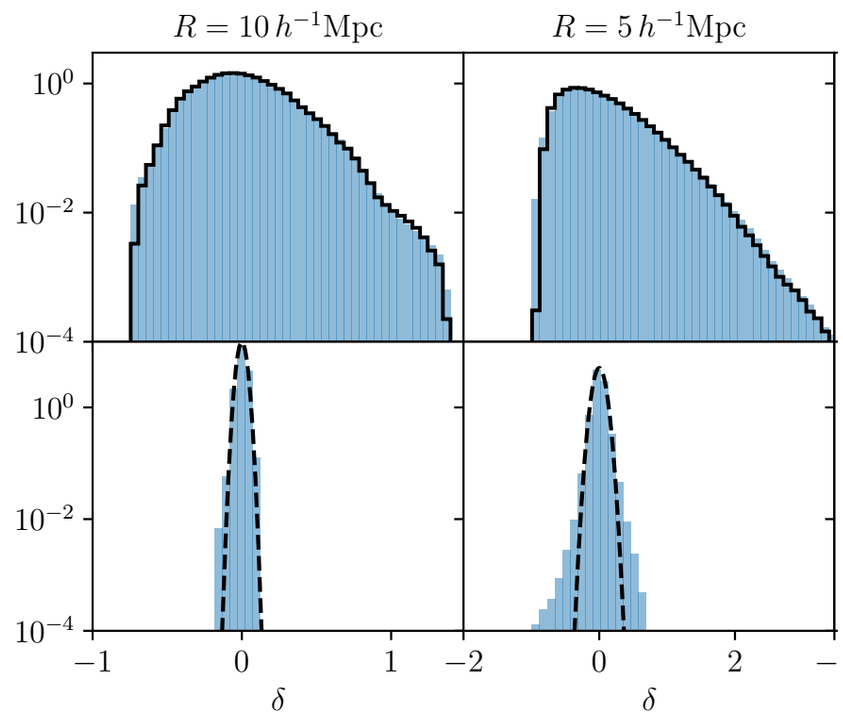


How about other statistics?

Void size function

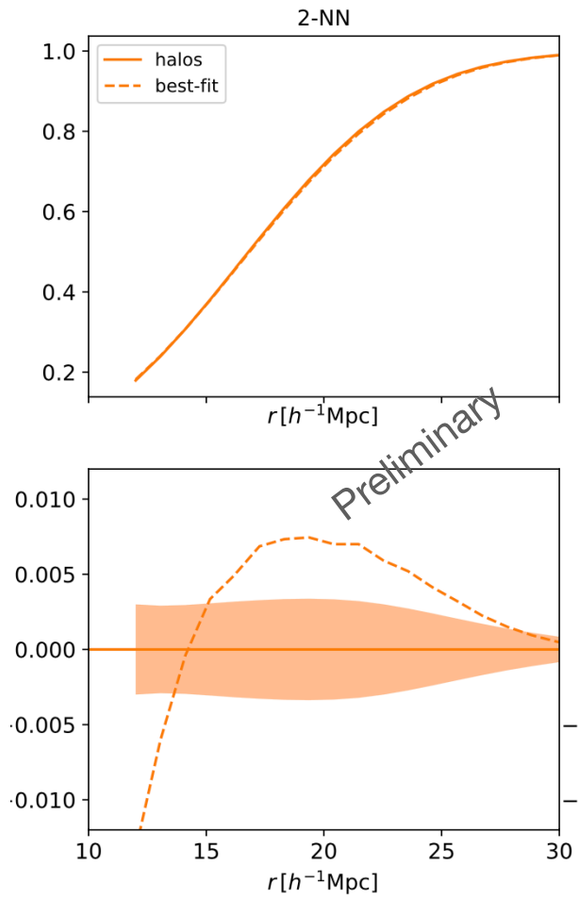


1D PDFs



AO+22

kNNs



Looking ahead

- Easily adaptable to any biased tracer!
- Realistic Fisher forecasts for HI: Pk vs ‘field-level’ analysis (in prep)
- Consistently combining constraints from non-Pk observables (1d PDFs, void-size function, kNNs etc) using field-level mocks (ongoing)
- Differentiable forward model in the full field-level inference… (first steps)
- Use ML to describe the residuals…

Conclusions

- PT + bias model at the field level works well for HI
- HI noise properties motivate beyond Pk analysis

- We provide code to generate fast and accurate HI field level mocks: **Hi-Fi mocks**
- Directly simulate HI field, no need to find halos –> differentiable
- Parallelised version almost ready (Jax version in the works)
- Useful for forecasts, mocks, covariances, future data analysis, KARABO?

Thank you!
