Model Based Systems Engineering

Is based in three pillars:

- **Systems Engineering methodology**
- **Modelling Framework (SE2)**
- **Tool – current preferred tool = CAMEO
NOMAGIC**

MBSE – Skills required

- Experience Systems Engineer
 - Systems Engineering Fundamentals
 - Domain Knowledge
- To model you need knowledge of the modelling:
 - Language
 - Tool
 - Framework
 - Method

Document-Based SE and MBSE

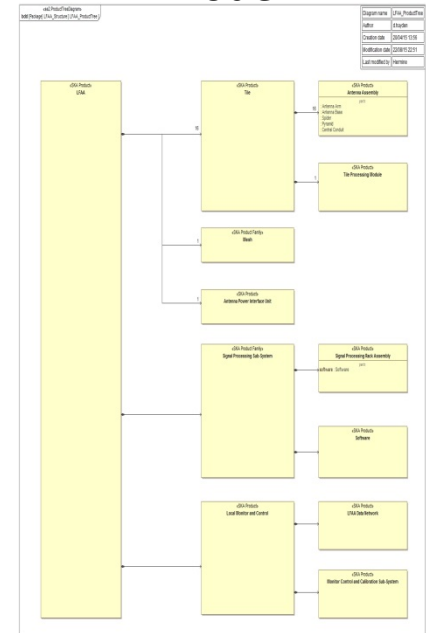

Project Documentation

System Engineering Tasks

- Requirements Engineering
- Architecture Design
- Assembly, Integration and Verification
- Technical Leadership

Model

The SE process

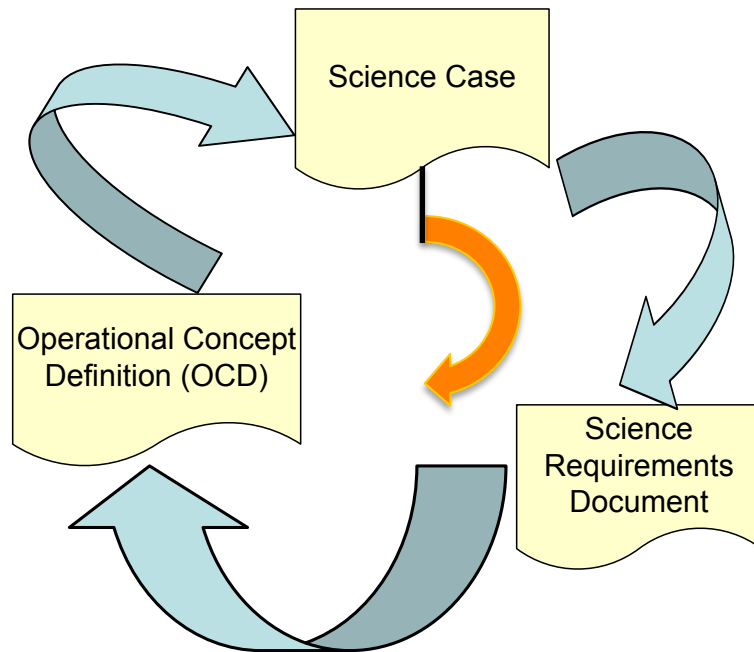

- Evaluation of the need or problem
 - Understanding your customer/client's needs
 - Ensure you understand all the directives and constraints
 - Operating Environment
 - Operational use
 - Functional analysis
 - Bounding of the problem (system)
 - Realisation of solution (implementing the functions)
 - Structural (mainly hardware realisation of functions)
 - Partitioning of system in building blocks
 - Behavioural definition and design (primarily software realisation)
 - System level architectural design
 - Analysis, capturing and management of requirements
 - Performance analysis
- IBM Software Thought Leadership White Paper, December 2011, "Model-based systems engineering: Revolution or evolution?", Barclay Brown, IBM Rational

Stakeholders Requirements

PROJECT DEFINITION AND PLANNING

Capture User Requirements

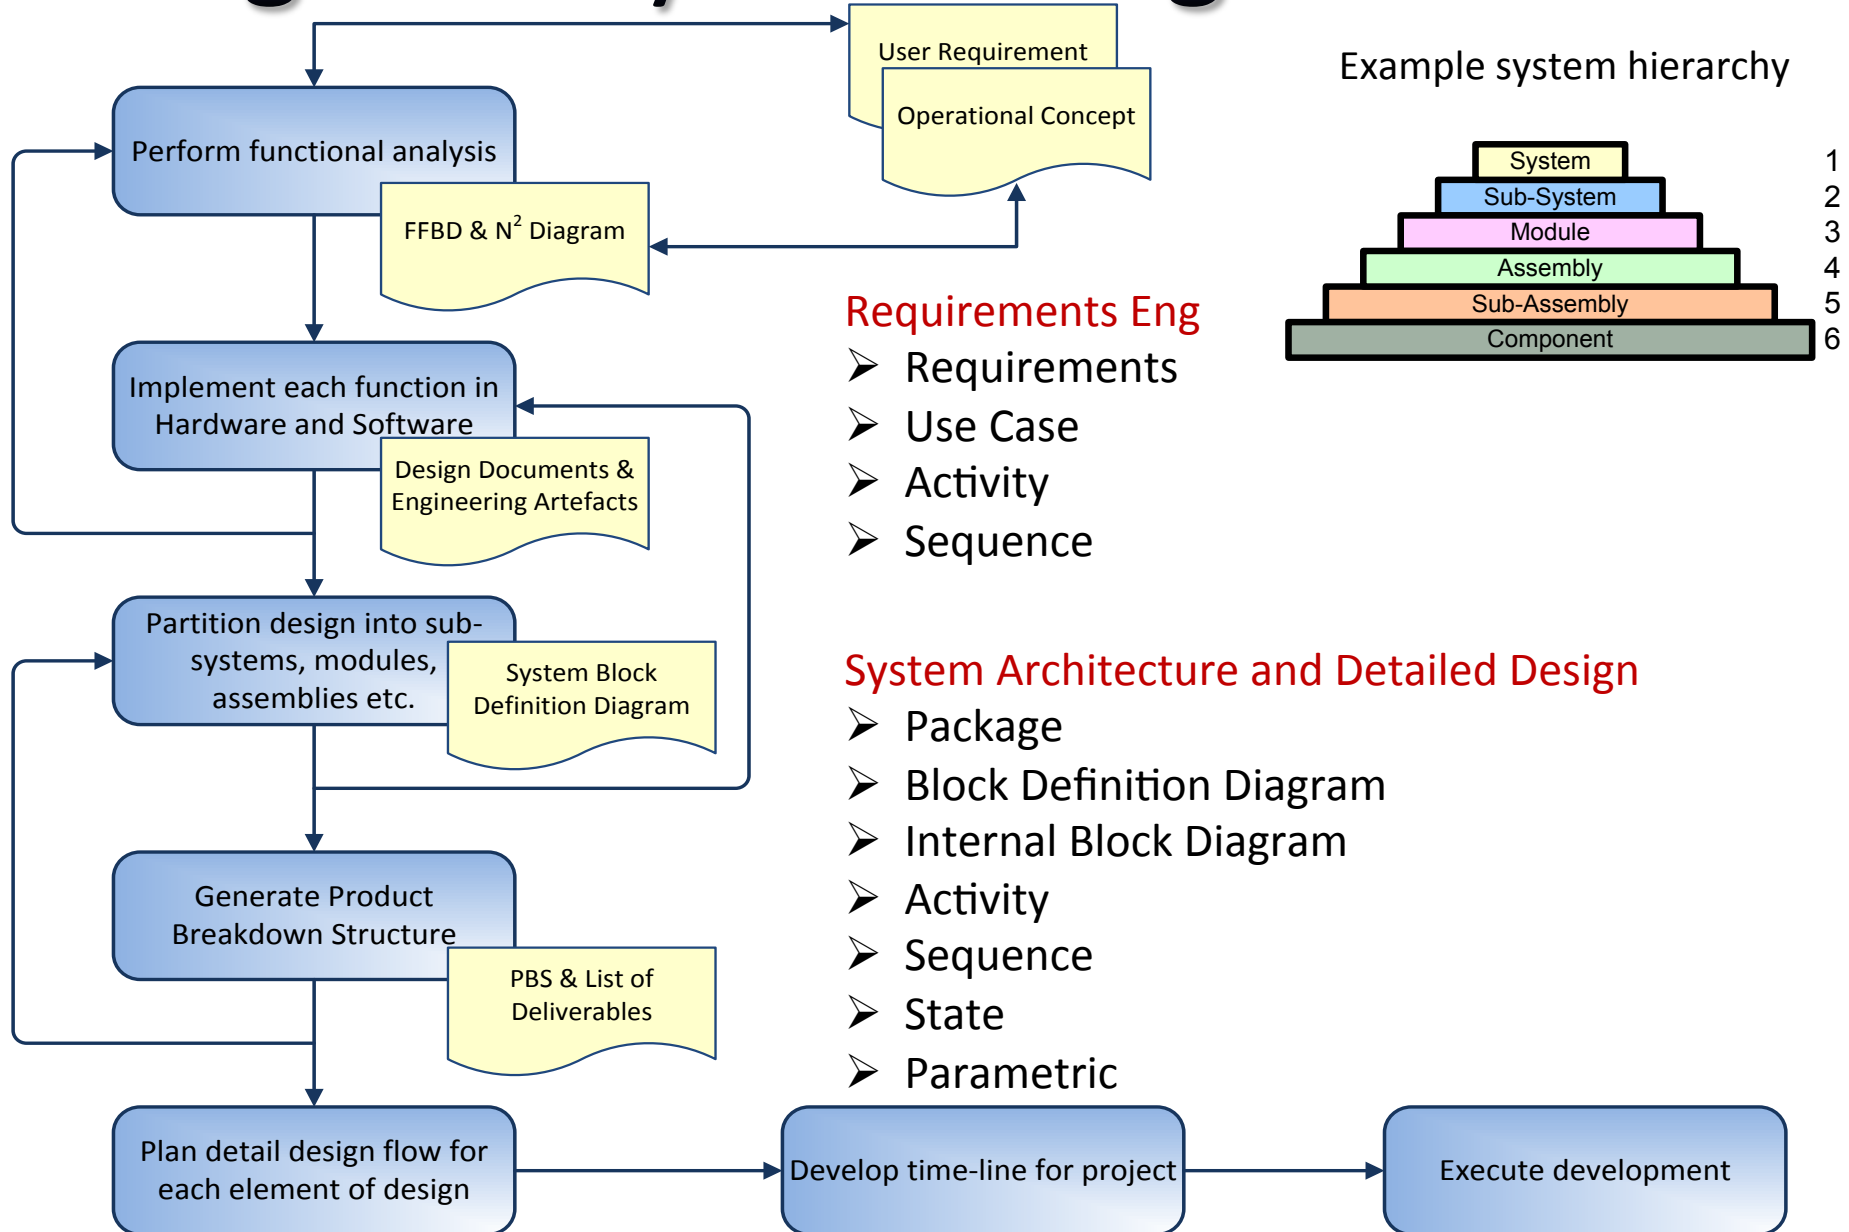

Process always starts with the science case!

Iterative and incremental during the concept and preliminary design but should be finalised and frozen as part of the Preliminary Design Review (PDR)

Integrated System Design Process

Document

I will just do the functional analysis, structural design & PBS in Visio

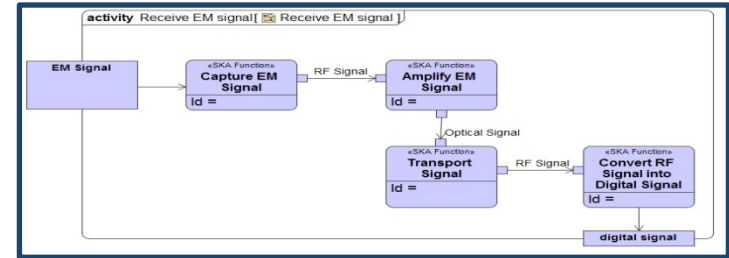

Deriving Requirements

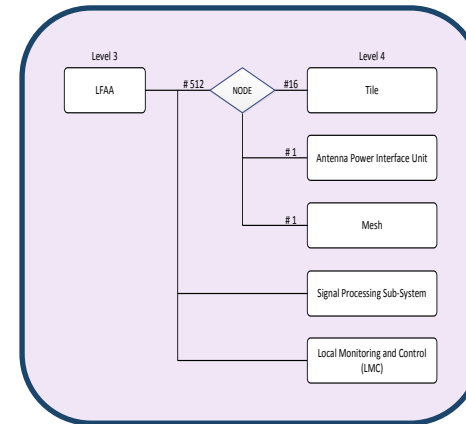

Manual Traceability

Specification is a by-product

Model Centric

Functional Model

Architectural Model

Test View

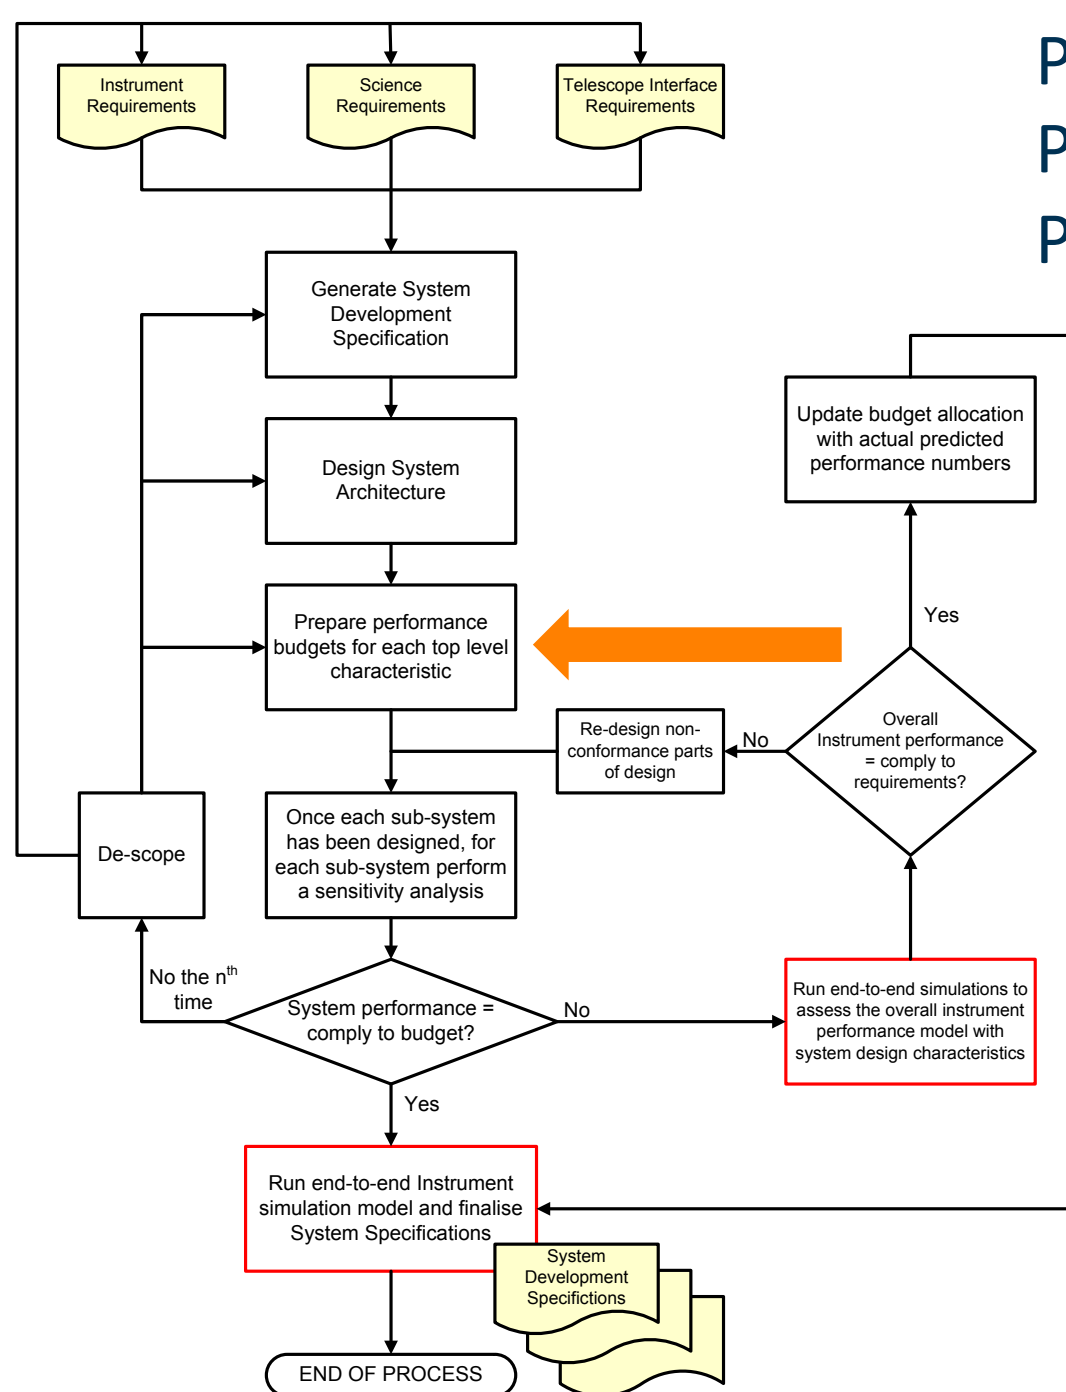

Performance Allocation and Performance Estimation Process

Performance allocation forms part of the “so called” requirements flow down process.

Verification

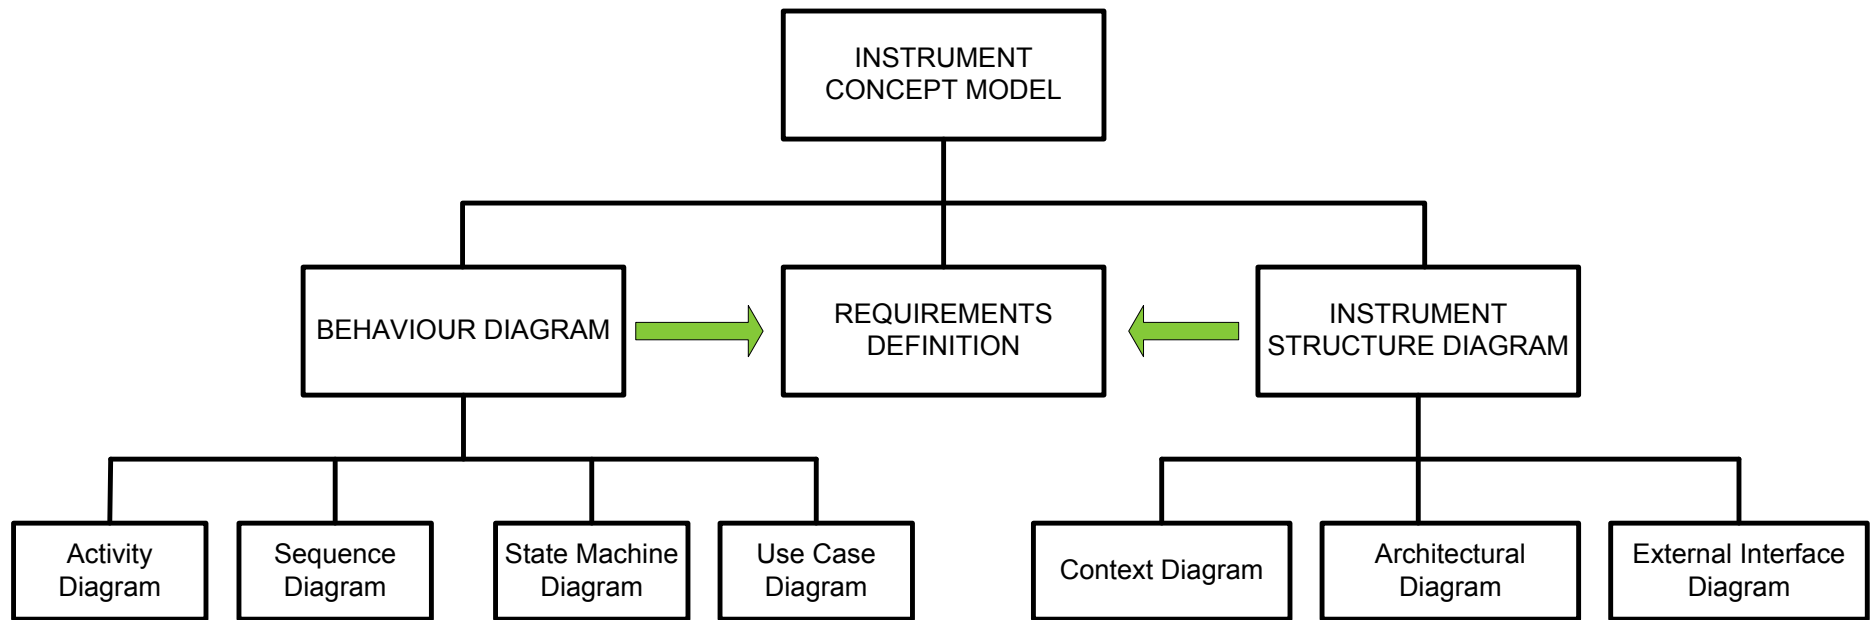

Performance estimation is the process used to predict whether the proposed solution will comply with the user requirements.

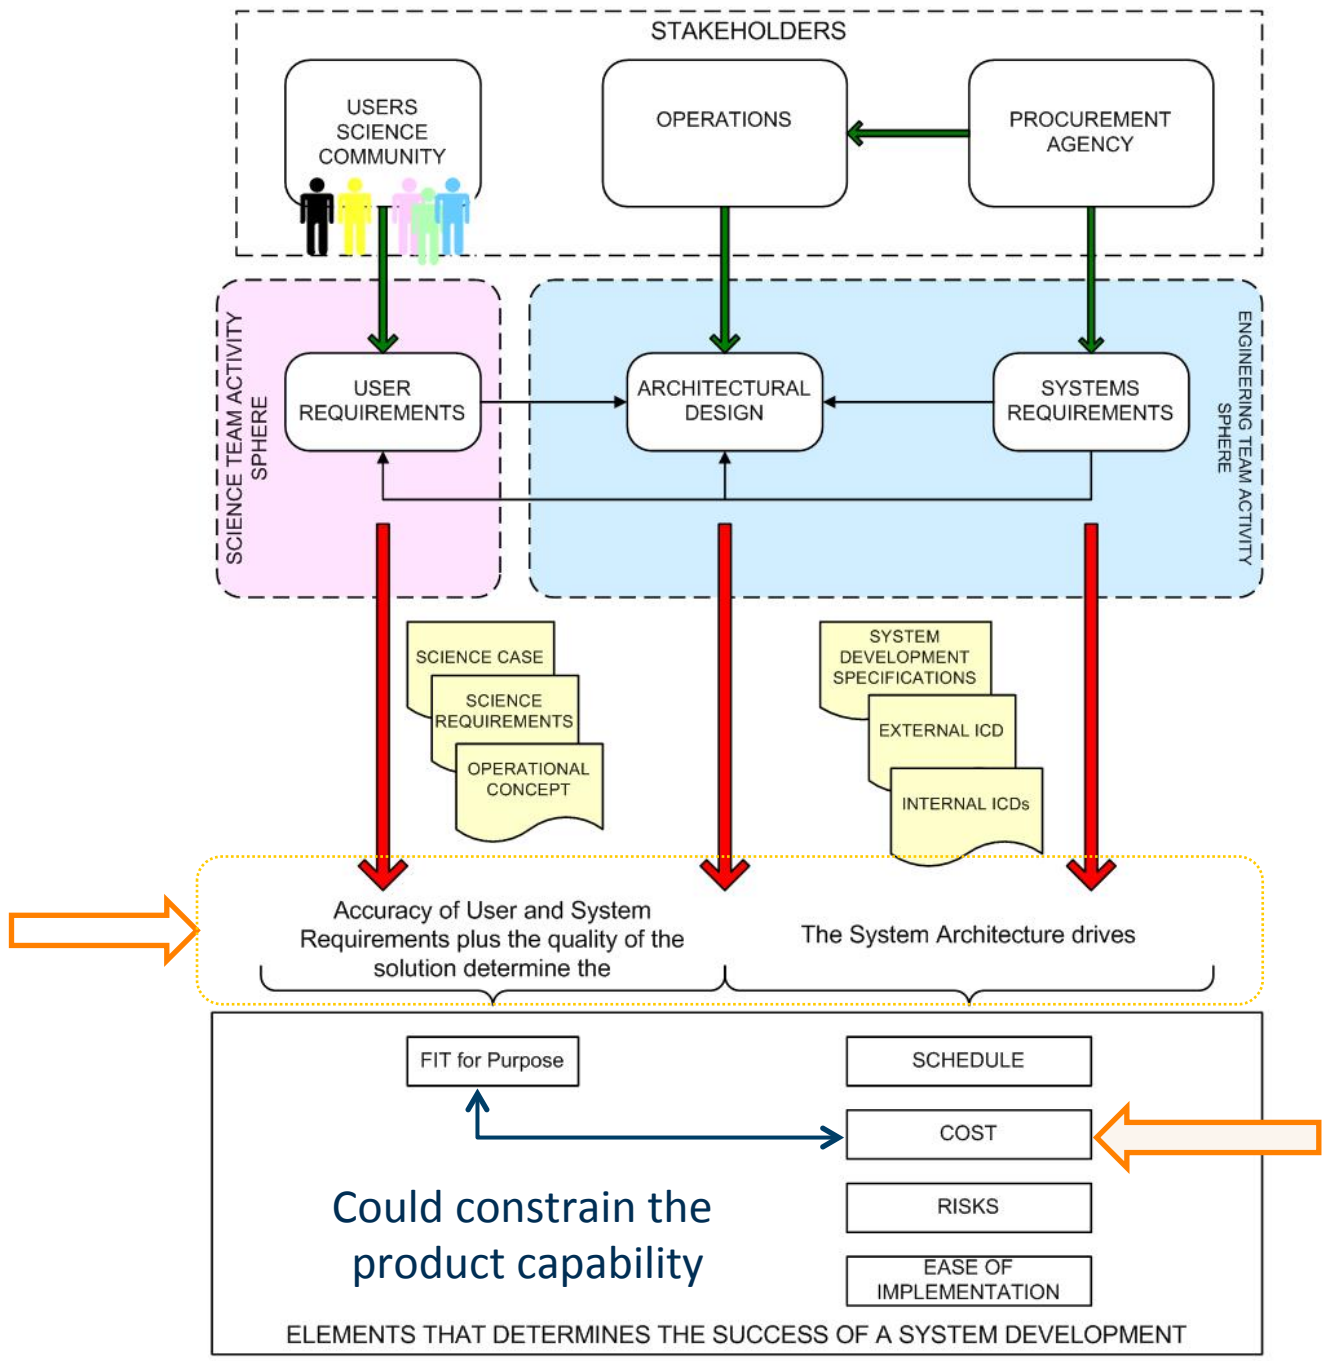

System Perspectives

Two Perspectives required to specify a system:

1. Describe the system by the functions it performs.
2. Physical architecture with interacting elements that will interact with one another and the environment to achieve the “mission”

Product Assurance

Typically a constraint
